

Create new space quickly and easily!

Piggy back spring

The piggy back spring creates space at a number of distances!

- Quick, easy installation on the dental arch
- Bypassing of existing brackets possible
- Power effect close to the root area
- Available in 6 different sizes

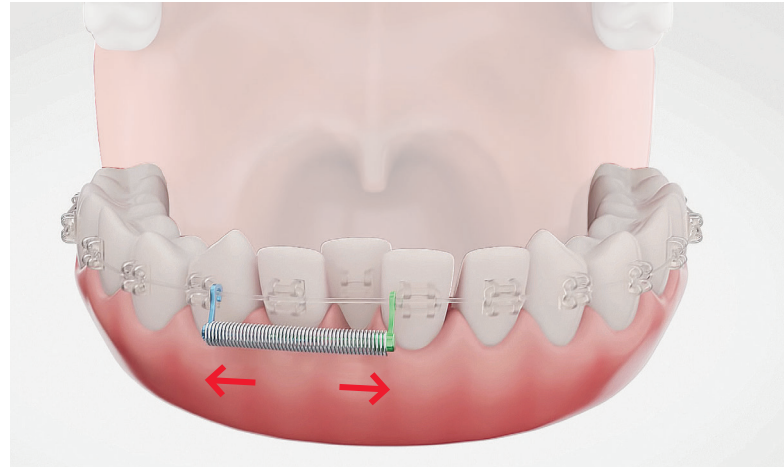

Product information

The piggy back spring is a pressure spring device specifically constructed to move teeth apart during orthodontic treatment. The piggy back spring is placed directly in the area of the crowding whilst bypassing one or more brackets. This leads to pressure on the outer teeth in the area of crowding in the levelling phase.

Main Indications

- Gaining space with front teeth crowding
- Outward rotation of teeth
- Distalization or mesialization of lateral teeth

Your Benefits

Six sizes for specific cases

Six different sizes enable space to be gained for individual misplacement and eye tooth to eye tooth distance can be extended.

Quick installation

The PiggyBackSpring is attached in a few seconds without removing the treatment arch. Brackets that are already in place do not have to be removed.

Strong & Effective

With full compression, the force provided is about 200 cN (progressively reducing).
